

ICT703 – Module 3 Workshop – Part 2

Activity 1: Rock Paper Scissors

Create a program that plays rock paper scissors – the computer against you.

You will need to generate a random number between 1 and 3 (for the computer's choice). To do this you can import the random module and then use randint. Put the following at the top of your code:

```
from random import randint  
randomChoice = randint(1,3)
```

You will first need to convert the random number to one for the three choices, then ask the player for their choice and finally figure out who wins !! Print the winner.

Part B: Repeat the game 5 times and keep score – at the end give the final score.

Activity 2: MattsBank gets Sophisticated

Enhance the bank program from module 2. Start by asking the person's name, account number and starting balance as before. Then repeatedly ask the user for their command. They can ask to "deposit", "withdraw", "balance" or "stop". For the first 2 you need to then ask the amount and update the balance. Keep asking until the person says "stop".
