

ICT703 – Module 11 Workshop

Learning Objectives

In this Workshop you will:

1. *Practice connecting to a SQL Database*

Activity 1: The Movie Database

The movie database from IMDB has over 45,000 movies with details on actors, release information and ratings. We are going to work on a subset of this database “IMDB Movies Database 1” to create a SQL database and table.

1. Create a SQL Database called IMDB
2. Create a table called movies with the columns in the datafile
3. Insert rows in your table (You could do this manually, or upload the file in SQL)
4. Create a python program to connect to this database ready to retrieve information.
5. Select all records and print them out.
6. Select all records where the rating is above 8.0

Activity 2: The MattBank Database

Mattbank is a premier bank and is looking to create a simple transactional database to record transactions (deposits and withdrawals) and provide a balance.

1. Create a SQL Database called MattBank
2. Create a table called transactions with the columns: data, accountno, transaction type, amount.
3. Create a python program that asks for your transaction and then inserts it into the database.
4. Extend the program to allow the person to get a list of their transactions (by accountno)
5. EXTRA: Create another table called account with the person’s details, their account number and their current balance.
6. EXTRA: Upgrade the first program to update the account table with the new balance after the transaction.
